I want a method to quickly learn things. The things must also be retained in my head.

Here is a general layout of what I am thinking:

1. The Problem Section

All things exist to solve one or more problems - a pain point. Mentioning the problem upfront grabs the readers attention and primes it to look for a solution. When the solution is presented, the reader is able to automatically filter out relevant details.

Often when I am presented with something, I am in a state of confusion. Which parts are relevant, which parts are just useless trivia to my end? My brain is confused and could miss or confuse the point of the presented solution.

What's the word limit on this section?

2. The Desire Section

Problem's give birth to desires. Desires are born out of pain to relieve pain. This section presents the reader of what we are intending to do. This is the final cause in Aristotle's four causes.

The desire is the solution target. One problem can be solved in many ways and one way can solve many problems. It is a many to many relationship.

In short, this section describes **what** we want to do to solve the problem. It should not contain **how** the problem is solved.

What's the word limit on this section?
